Theory. Vibration is an oscillatory motion. Any body with mass and elasticity can vibrate. The simplest type of vibrating system is called a single-degree-of-freedom spring-mass system. The spring is characterized by its spring rate, K , and a mass, M . This system is called a single-degree-of-freedom system because motion can occur in only one ...

Image Source Main Components of a Biosensor. The block diagram of the biosensor includes three segments namely, sensor, transducer, and associated electronics. In the first segment, the sensor is a responsive biological part, the second segment is the detector part that changes the resulting signal from the contact of the analyte and for the results it displays in an accessible way.

This is the natural vibration the arrow experiences when subjected to a brief but large force. It's similar to hitting something with a hammer and it vibrating as a result. The force acting on the arrow is equal to the draw force as the archer pulls the string back to the release position (at full draw).
